

Escaping Inequality in India: The Role of English-Medium Instruction

Rishav Roy

1 Research question and contribution

What is the effect of exposure to English-medium instruction enrollment in 2007–08 on the growth of local consumption from 2007–08 to 2017–18?

This section should preserve the corresponding prose from the legacy Rmd/PDF: the contribution relative to previous literature, the use of consumption rather than wages, the district pseudo-panel, and the two-part empirical methodology.

2 Education participation, variable construction, and missingness

Insert the current Section 3 material here, including the EMIE definition, the probit model, district-level supply-side aggregates, the father-education proxy discussion, and the MCAR/missingness discussion.

3 Instrumental variable

Insert the current Section 4.2 material here, including population-weighted linguistic distance from Hindi, relevance, Shastry’s argument, the inability to replicate the exclusion-restriction justification yet, and the condition-number/state-FE problem.

4 Main interpretation limits and planned remedies

Insert current text on current methodological limitations, state fixed effects, district matching, first-difference 2SLS, migration, spatial spillovers, and local inflation/shocks.

5 First stage

Insert the current first-stage results table and interpretation.

6 Second stage

Insert the current second-stage results table and interpretation.

7 Interpretation of the 2SLS estimates

Insert the current discussion of the small/noisy estimate, bad controls, spillover attenuation, and why the null result should be interpreted cautiously.

8 District harmonization

Insert the current appendix material on district harmonization assumptions, algorithm, source errors, many-to-many matching, and planned redesign.
